

Executive Summary – Project Issue & Path Forward

Project: Treasure Chess App

Situation

The lead developer responsible for building and managing the application is no longer available. As a result, the business currently does not have full access or control over the system.

Key Problem

We are unable to deploy or operate the app because critical access is missing, including:

- Source code repository
- Backend systems
- Deployment accounts
- API keys and credentials
- Payment / blockchain configuration

Business Risk

- Loss of operational control
- Inability to launch or maintain the product
- Potential financial and security exposure (due to payment systems)

What Is Needed

To move forward, we must secure control of the system by either:

Option 1 – Recover Access (Preferred)

Obtain:

- All accounts and logins
- Source code access
- Environment/configuration files

Option 2 – Rebuild Control

If access cannot be recovered:

- Recreate backend systems
- Issue new credentials and keys
- Reconnect or rebuild the application under company ownership

Recommended Next Step

Immediately attempt to recover access from the developer or any internal records.

If unsuccessful, proceed with a structured rebuild to ensure the business has full ownership and control.

Bottom Line

The application itself likely works, but the business currently **does not control the infrastructure required to run it.**

Resolving access is the priority before any deployment can occur.
